Information

WHY CHASE ORGANICS SM6 IS THE No.1 SEAWEED EXTRACT

- 1.) Expanding world wide sales are proof that the product works on an extensive range of crops.
- 2.) **SM6** is manufactured from a selected blend of seaweed varieties, giving a balanced content of active ingredients. **SM6** is a natural development from the successful **SM3**.
- 3.) The aqueous extraction process is by a unique two stage method using no chemical solvents. It has been shown that aqueous extraction can provide more positively active products than systems using solvents.
- 4) **SM6 contains a minimum of 30 per cent w/v of PURE soluble seaweed solids, higher than most other products. This reflects relative activity and its plant boosting potential.**
- 5) Chase extracts have been proven in over 20 years of trials, an historical record to be proud of. **SM6** is licenced for use on Certified Organic crops and can also be used on Conservation Grade crops.

Plant growth stimulants extracted from seaweed positively encourage :-

Plant cell division

Enlargement of the rooting area

Maximum photosynthetic activity from increased chlorophyll content.

Other positive benefits will follow:-

Increased resistance to both growth and disease stress.

Improved nutrient/trace element uptake

Improved marketable yield.

Repeated applications of **SM6** will encourage a build up of the soil microbial activity leading to improvement in soil fertility and a corresponding reduced dependency on chemical inputs.

There are a number of liquid seaweed products in the market place and care should be taken to relate price to quality and proven ability.

The certified PURE seaweed solids in a liquid seaweed product are the vital link when assessing and comparing products. The ability of the product to provide beneficial results when used at recommended application rates is linked to the plant growth stimulant content which is in turn linked to the solids content.

"Buy certified products with a quality reputation and a good historical record"
